

# Agaricus Strains

## Hybrid Off-whites (Rye or Millet)

Hybrid off-whites perform extremely well in a variety of conditions and are highly suited for fresh markets due to their excellent shelf-life. These strains produce high yields of excellent quality with proper handling and environment.

- **Strain 901:** Our most popular and best selling large strain. A mid-range hybrid leaning more towards a U1 type. Produces large quantities of high-quality mushrooms with a well-rounded cap suitable for the fresh market. It is a very forgiving strain that responds well to a wide range of cropping and sizing techniques.
- **Strain 950:** Another mid-range hybrid closer to a U1 type. It gives slightly more separation than the 901, and has a slightly denser and more rounded cap. It yields well and produces larger size mushrooms appropriate for the gourmet market.
- **Strain 528:** A mid-range hybrid that is a very fast and prolific pinner. This strain yields well and produces high-quality, medium-size mushrooms that are fitting for the fresh market.

## Old Fashioned Brown (Rye or Millet)

Brown strains are more sensitive and less forgiving than hybrid off-whites. Over-watering and sharp environmental changes should be avoided. Cap color will darken with the introduction of light. Good harvesting techniques and pruning are vital for Portabella development.

- **Strain 805:** An old fashioned brown strain that is very consistent and lends itself to either Portabella or crimini cultivation. Adding light at the correct time, as well as chlorine, helps develop mushrooms with a rich brown color.

## Casing Inoculum (CAC)

Growers consider our CAC to be the most reliable and superior product available. Lambert's two product formulas (synthetic or compost) are compatible with all commercial strains.
